

$$[13.19] \text{ Show that } T^{-1} = \frac{n}{\overline{\pi}} \quad \begin{array}{c} \text{Diagram of } T \\ \text{A horizontal line with } n \text{ vertical arrows pointing down.} \end{array}$$

(This annotates Beckmann's solution.)

Pf: Suffices to show  $TT^{-1} = T^{-1}T = I$ . We do the former and leave the latter as similar. Note that  $T^{\frac{1}{2}}$  is simply a number. So it commutes with  $\epsilon$  and  $\epsilon$ .

Also, we use the Einstein summation convention.

$$(A) TT^{-1} = \left[ \begin{array}{c} \downarrow \\ \downarrow \end{array} \right]^{-1} = \frac{n}{\overline{\pi}} \quad \begin{array}{c} \text{Diagram of } TT^{-1} \\ \text{A horizontal line with } n \text{ vertical arrows pointing up.} \end{array}$$

$$= \frac{n}{n! \det(T)} T^a_n \delta^{\bar{a}}_{\bar{n}} \epsilon^{n \dots u} T^b_n \dots T^d_u \epsilon_{\bar{a} \bar{b} \dots \bar{d}}$$

$$= \frac{n}{n! \det(\pi)} \delta^{\bar{a}}_{\bar{n}} \epsilon^{n \dots u} T^a_n T^b_n \dots T^d_u \epsilon_{\bar{a} \bar{b} \dots \bar{d}}$$

$$(B) = \frac{n}{\overline{\pi}} \quad \begin{array}{c} \text{Diagram of } T^{-1}T \\ \text{A horizontal line with } n \text{ vertical arrows pointing up.} \end{array}$$

Claim 1:  $\begin{array}{c} \text{Diagram of } T^{-1}T \\ \text{A horizontal line with } n \text{ vertical arrows pointing up.} \end{array} = n! \begin{array}{c} \text{Diagram of } T^{-1}T \\ \text{A horizontal line with } n \text{ vertical arrows pointing up.} \end{array} \dots$

$$\text{LHS} = n! \epsilon^{n \dots u} \delta^{\bar{a}}_{\bar{n}} T^a_n T^b_n \dots T^d_u \epsilon_{\bar{a} \bar{b} \dots \bar{d}}$$

$$\text{RHS} = n! \epsilon^{n \dots u} \delta^{\bar{a}}_{\bar{n}} T^a_n T^b_n \dots T^d_u \epsilon_{\bar{a} \bar{b} \dots \bar{d}}$$

$$\text{LHS} = n! \left( \frac{1}{n!} \right) \sum_{\pi} \text{sign}(\pi) \epsilon^{n \dots u} \delta^{\bar{a}}_{\bar{n}} T^{\pi(a)}_n T^{\pi(b)}_u \dots T^{\pi(d)}_u \epsilon_{\bar{a} \bar{b} \dots \bar{d}}$$

where  $\pi$  is a permutation of  $(a, b, \dots, d)$  and  $\text{sign}(\pi) = \begin{cases} 1 & \text{if } \pi \text{ is an even permutation} \\ -1 & \text{o.w.} \end{cases}$

[13.19 cont] Freeze the Einstein summations for a moment. Then LHS has  $n!$  terms. We will show,  $\stackrel{(1)}{\text{sign}}(\pi) \in \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^{\pi(u)} \dots T_{\bar{u}}^{\pi(d)} \epsilon_{\bar{a} \bar{b} \dots d}$   
 $= \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^{\bar{a}} \dots T_u^d \epsilon_{\bar{a} \bar{b} \dots d}$  for each  $\pi$ . That will show that  $\text{LHS} = \text{RHS}$ .

Since every permutation  $\pi$  can be generated from a series of pairwise swaps, it suffices to show that (1) holds for every pairwise swap between members of  $(a, \dots, d)$ . There are 2 kinds of swaps. External swaps are ones involving the external superscript "a". Internal swaps are those not involving a.

### Case 1. External Swaps

We show (1) holds for a swap of a with d but the argument holds for any other internal superscript besides d. To swap a and d, first a undergoes  $(n-1)$  swaps to the right; then d undergoes  $(n-2)$  swaps to the left. The total is  $2n-3$ , an odd number. If  $\pi$  is the swap of a with d,  $\text{sign}(\pi) = -1$ . So

$$\begin{aligned} \text{LHS} &= -\epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^d T_s^b \dots T_u^q \epsilon_{\bar{a} \dots d} \\ &= -\epsilon^{n \dots m} \delta_{\bar{n}}^{\bar{a}} T_{\bar{n}}^{\bar{a}} T_n^d T_s^b \dots T_m^q \epsilon_{\bar{a} \dots d} \quad [\text{Rename } n \text{ as } m \text{ and } u \text{ as } m] \\ &= -(-1)^{2n-3} \epsilon^{m \dots n} \delta_{\bar{n}}^{\bar{a}} T_{\bar{n}}^{\bar{a}} T_n^d T_s^b \dots T_m^q \epsilon_{\bar{a} \dots d} \quad [\text{Swap } n \text{ and } m \text{ in } \epsilon, \text{ which is antisymmetric}] \\ &= \epsilon^{m \dots n} \delta_{\bar{n}}^{\bar{a}} T_n^d T_s^b \dots T_m^q \epsilon_{\bar{a} \dots d} \\ &= \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_u^d T_s^b \dots T_n^q \epsilon_{\bar{a} \dots d} \quad [\text{Rename } m \text{ as } n \text{ and } n \text{ as } u] \\ &= \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^q T_s^b \dots T_u^d \epsilon_{\bar{a} \dots d} \quad [\text{Rearrange the numbers } T_n^q, \dots, T_u^d] \\ &= \text{RHS} \end{aligned}$$

### Case 2. Internal Swaps

We show for a swap of b and d but the argument holds for any 2 internal superscripts. The swap involves  $(n-2)$  pairwise swaps to the right followed by  $(n-3)$  swaps to the left, for a total of  $2n-5$ , an odd number of swaps. Thus

$$\begin{aligned} \text{LHS} &= -\epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^q T_s^d \dots T_u^b \epsilon_{\bar{a} \bar{b} \dots d} \\ &= +\epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^q T_s^d \dots T_u^b \epsilon_{\bar{a} \bar{d} \dots b} \quad [\text{Swap b and d in } \epsilon] \\ &= \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^q T_s^b \dots T_u^d \epsilon_{\bar{a} \bar{b} \dots d} \quad [\text{Rename b as d and d as b}] \\ &= \text{RHS} \end{aligned}$$

[13.19 cont]. We have shown that (B.) can be rewritten as

$$(C) \quad \frac{n}{\prod_{i=1}^n i!} \quad \frac{1}{n!} \quad \begin{array}{c} a \\ \hline \bar{a} b \dots d \\ \hline \bar{b} c \dots u \\ \hline \dots \\ \hline n \end{array}$$

Beckmann claims that by splitting RHS according to Fig 12.18 yields

$$(D) \quad \frac{n}{\prod_{i=1}^n i!} \quad \frac{1}{n!} \quad \begin{array}{c} a \\ \hline \dots \\ \hline \bar{b} c \dots u \\ \hline \dots \\ \hline n \end{array}$$

Recall Fig 12.18:  $\frac{1}{1 \dots 1} = \frac{1 \dots 1}{1 \dots 1}$  This split lacks both  $\not\downarrow$  and externals.

I believe the split from (C) to (D) requires proof, I cannot prove it. I can prove 2 things that generalize Fig 12.18 but not (D). My "claim" on p.1 results in

$$(D') \quad \frac{n}{\prod_{i=1}^n i!} \quad \frac{1}{n!} \quad \begin{array}{c} a \\ \hline \bar{b} c \dots u \\ \hline \dots \\ \hline n \end{array}$$

Q can also show

$$\text{Claim 2: } \begin{array}{c} a \dots d \\ \hline \bar{a} \dots \bar{u} \\ \hline n \dots u \end{array} = \begin{array}{c} \dots \\ \hline \bar{a} \dots \bar{u} \\ \hline n \dots u \end{array} \quad (\text{Note: No externals})$$

$$\begin{aligned} \text{LHS} &= n! \epsilon^{n \dots l} T_{l \dots n}^a \dots T_u^d E_{a \dots d} = n! \left( \frac{1}{n!} \right) \sum_{\pi} \text{sign}(\pi) \epsilon^{n \dots u} T_n^{\pi(a)} \dots T_u^{\pi(d)} E_{a \dots d} \\ &= \sum_{\pi} \text{sign}(\pi) \epsilon^{n \dots u} T_n^{\pi(a)} \dots T_u^{\pi(d)} [\text{sign}(\pi) E_{\pi(a) \dots \pi(d)}] \\ &= \sum_{\pi} \epsilon^{n \dots u} T_n^{\pi(a)} \dots T_u^{\pi(d)} E_{\pi(a) \dots \pi(d)} \stackrel{(*)}{=} \sum_{\pi} \epsilon^{n \dots u} T_n^a \dots T_u^d E_{a \dots d} \\ &= n! \epsilon^{n \dots u} T_n^a \dots T_u^d E_{a \dots d} \\ &= \text{RHS} \end{aligned}$$

(\*) Rename  $\pi(a)$  as  $a$ ,  $\pi(b)$  as  $b$ , ...,  $\pi(d)$  as  $d$

Proving (D) is much more difficult I believe

[13.19 cont] I can use Fig 12.8 and Claim 2 to reduce (c)  $\Rightarrow$  (d) to a different problem,

$$(C') \Rightarrow (D'): \text{ Let } (C'') = \frac{1}{n!} \begin{array}{c} \text{Diagram of } C'' \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array}$$

$$\text{and } (D') = \frac{1}{n!} \begin{array}{c} \text{Diagram of } D' \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array}$$

If  $(C') \Rightarrow (D')$ , then

$$\frac{1}{n!} \begin{array}{c} \text{Diagram of } C \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array} \stackrel{C \Rightarrow D}{=} \frac{1}{n!} \begin{array}{c} \text{Diagram of } D \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array} \stackrel{\text{Claim 2}}{=} \frac{1}{n!} \begin{array}{c} \text{Diagram of } D' \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array} \stackrel{\text{Fig 12.8}}{=} \frac{1}{n!} \begin{array}{c} \text{Diagram of } D'' \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array}$$

$$\Rightarrow [(C) = (D)]$$

$$\begin{aligned} (C') &= \frac{1}{n!} \epsilon^{n \dots u} \delta_{\bar{n}}^{\bar{a}} T_n^a T_s^b \dots T_u^d \epsilon_{\bar{a} b \dots d} \\ &= \frac{1}{n!} \sum_{\pi} \delta_{\bar{n}}^{\bar{a}} \epsilon^{n \dots u} T_n^{\pi(a)} T_s^{\pi(b)} \dots T_u^{\pi(d)} \epsilon_{\bar{a} b \dots d} \\ &= \frac{1}{n!} \sum_{\pi} \delta_{\bar{n}}^{\bar{a}} \epsilon^{n \dots u} T_n^{\pi(a)} T_s^{\pi(b)} \dots T_u^{\pi(d)} \epsilon_{\bar{a} b \dots d} \\ &= \frac{1}{n!} \epsilon^{n \dots u} T_n^{\pi(a)} T_s^{\pi(b)} \dots T_u^{\pi(d)} \epsilon_{\bar{a} b \dots d} \quad (\text{rename } \bar{n} \text{ to } \bar{a}) \end{aligned}$$

$$\begin{aligned} (D') &= n! \epsilon^{n \dots u} T_n^a \dots T_u^d \epsilon_{a \dots d} \\ &= n! \cancel{(n!)} \sum_{\pi} \epsilon^{n \dots u} T_n^{\pi(a)} \dots T_u^{\pi(d)} \epsilon_{a \dots d} \end{aligned}$$

Why are they equal?

Finishing this problem... the two  $\underline{T \dots T}$  cancel, leaving

$$(E) = \frac{n}{n!} \begin{array}{c} \text{Diagram of } E \\ \text{A grid with } n \text{ columns and } n \text{ rows. Arrows point from the bottom row to the top row.} \end{array} \stackrel{\text{Fig 12.8}}{=} \frac{n}{n!} (n-1)! = \frac{n}{n!} | = I$$

□
